Project Title:

National Accounts Statistics of India Using Python

1. Overview

This project focuses on cleaning and analysing National Accounts Statistics data using Python. It identifies missing values, duplicate records, and inconsistencies, followed by statistical analysis and visualization to understand economic trends.

2. Objectives of the Study

1. To understand the structure of the dataset.
2. To identify and handle missing values.
3. To detect and remove duplicate records.
4. To identify and correct inconsistent data.
5. To check and correct data types.
6. To clean and standardize column names.
7. To perform descriptive statistical analysis.
8. To calculate mean, median, and standard deviation for suitable numerical variables.
9. To analyse year-wise changes in economic indicators.
10. To compare economic indicators across industries.
11. To create graphs and charts for data visualization.
12. To identify patterns and trends in the dataset.
13. To save the cleaned dataset in CSV format.
14. To improve data quality for further analysis.

3. Tools and Technologies Used

Tool	Purpose
Python	Programming and analysis
Pandas	Data cleaning and manipulation
NumPy	Numerical calculations
Matplotlib	Data visualization
Seaborn	Statistical charts
Google Colab	Python coding environment

4. Conclusion

This project aims to improve the quality of National Accounts Statistics data through Python-based data cleaning and analysis. Statistical methods and visualizations will be used to explore economic indicators, identify trends, and prepare a reliable cleaned dataset for further analysis.
